Design principle:
    Hierarchy: physical & vertical things.
    Modularity: components with specific functions.
    Encapsulation: keep data stored in components;
                      accessed via interface.

build information model (class / catalog).
        ↓

fill in with instance (data) ⇐ it is the object we
                                  build

class → define model.
object → fill data
array do both things.
